Location	Cape Town Office (Stellenbosch)	Working model	Hybrid (2 days in office)
Division	Product Build		

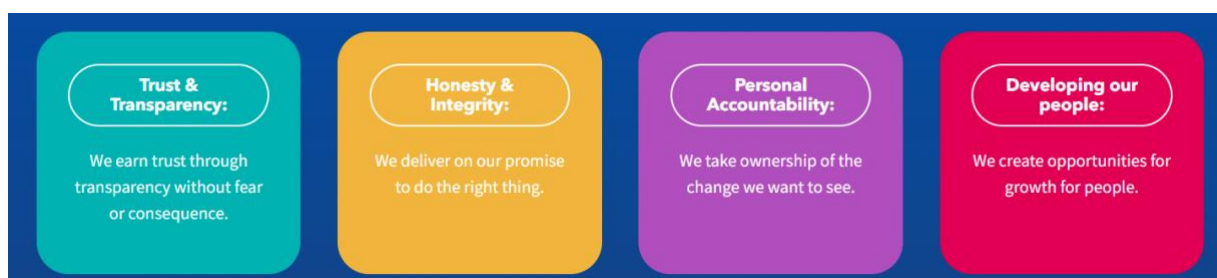

THE GENASYS STORY

The Genasys story began in 1997 with a founder who recognised that software was the key to revolutionising insurance efficiency and delivering exceptional customer experiences. Over 25 years we've grown into a recognised Insurtech leader with a strong foothold in South Africa and the UK, expanding into international markets. Our mission is to be the preferred software solutions partner to the insurance industry across Europe, Africa, and the rest of the world.

We deliver a comprehensive and dynamic insurance management system. It's a modular, cloud-based solution that can be applied to any insurance business, adapting seamlessly regardless of currency, language, or destination. Our platform provides end-to-end policy administration, covering the entire insurance policy lifecycle. This includes intuitive, no-code tools for building wholesale and retail quote-and-bind journeys, seamless renewals, mid-term adjustments, and cancellations. It empowers insurers, MGAs, and brokers to create customised, optimised workflows, manage complex currency, taxation, and multiple languages across regions, and support alternative insurance models such as parametric, micro, or embedded products.

We believe our people are critical to our success. We are deeply committed to fostering an environment of continuous learning and development, supporting our teams to drive technological expansion and attract top talent.

THE GENASYS CULTURAL DNA

ABOUT THE ROLE

As a **C# Developer** at Genasys, you will be responsible for performing key software development lifecycle (SDLC) activities, including:

- Collaborating with product owners and architects to effectively translate business and technical software requirements into commercialized product deliverables to satisfy client needs.
- Translating requirements into technical specifications and conducting impact analysis of the solution.
- Implementing technical specifications and developing new product features.
- Updating development stream management tools, merging code, and maintaining version controls using Git.
- Conducting product development testing before release to the quality assurance team.
- Conducting demos of completed development.
- Creating user documentation.

This role requires someone who is a proactive problem-solver and enjoys working independently or within a team-based structure. While our developers work on individual projects, we encourage a collaborative and supportive environment where solutions and ideas are shared to achieve the best possible outcomes.

QUALIFICATIONS, TECHNOLOGIES, AND EXPERIENCE REQUIRED

You are naturally curious and passionate about continuous learning and development. You enjoy learning about new technologies and tools, and you are already AI-savvy.

You have good communication, interpersonal and collaboration skills. You also enjoy knowledge sharing and make the time to either share your knowledge with teammates or learn from them.

You are an experienced developer with a solid understanding of the SDLC, software design patterns, test-driven development, and Object-Oriented (OO) design principles.

You have good working knowledge of:

- C#
- .Net Core 3.1 and .NET 6
- Restful APIs
- Cloud Knowledge - specifically Azure
- Source Control (Git)
- Entity Framework Core

The following will be an added advantage:

- Atlassian Suite (specifically Jira and Confluence)
- Domain Driven Design (DDD)
- Distributed Computing Experience (Microservices)
- Insurance, Insurtech, financial services, and/or FinTech knowledge and experience

PARAMETERS OF THE JOB

- **CONSTRAINTS:** Compliance with all company policies and procedures
- **OVERTIME:** Will be required from time to time
- **TRAVEL:** There could be traveling between offices (not frequently)

Key Performance Area (KPA)	Task within determined KPA
